WPI; 1996-129401/13.

Purifying recombinant hepatitis C virus (HCV) E1 and E2 envelope proteins - in presence of disulphide bond cleavage agent, to produce proteins suitable for direct use in vaccines or diagnostic assays of HCV.

Claim 23; Fig 21; 146pp; English.

and B2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant B1, B2, and B1/B2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or in reduction step with a disulphide constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more

                                                                                                                                                                                                                                            ၀
serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed BI, R2 and BI/R2, and sliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known techniques
                                                                                                                                                                                                                               ATGTTGGGTAAGGTCATCGATACCCTTACATGCGGCTTCGCCGACCTCGTGGGGTACATT

The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody the tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            780
                                                                                                                                                                                               9
                                                                                                                                                                                                                        9
                           The invention comprises an Hepatitis C virus (HCV) vaccine for reducing liver disease. The vaccine of the invention comprises an HCV B1 or E2 protein as an antigen. The HCV vaccine is useful for reducing liver disease (e.g. liver fibrosis) in a chromic HCV infected mammal. The present DNA sequence encodes an HCV B1 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in viro monitoring of HCV disease or prognosing the response to in viro monitoring from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 183

                    The invention comprises an Hepatitis C virus (HCV) vaccine for reducing liver disease. The vaccine of the invention comprises an HCV B1 or E2 protein as an antigen. The HCV vaccine is useful for reducing liver disease (e.g. liver fibrosis) in a chronic HCV-infected mammal. The present DNA sequence encodes an HCV E1/E2 protein.

and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serotyping assay for detecting one or more can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates containing proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     123

```
and R2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. In vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide constructs containing the purified RCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serotyping assay for detecting one or more serological types of HCV present in a biological sample. The constructs can also be immobilised on a solid substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed B1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more centive with human sera than those isolated by known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GAGGACGGCGTGAACTATGCAACAGGGAATTTGCCCGGTTGCTTTCTCTATCTTCTTC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises an Hepatitis C virus (HCV) vaccine for reducing liver disease. The vaccine of the invention comprises an HCV El or E2 protein as an antigen. The HCV vaccine is useful for reducing liver disease (e.g. liver fibrosis) in a chronic HCV-infected mammal. The present DNA sequence encodes an HCV El/E2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis C virus; HCV; vaccine; liver disease; El protein; E2 protein; liver fibrosis; ds; gene.

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRBS) region coding for one or more NS3, NS5A, or EMCV IRBS mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cell or which containing a functional HCV replicon; (5) an HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV
                                                                                                           New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRBS) region, useful in studying HCV replication and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GCCTTGCCATATGATGATGAACTCGCCTACAACGGCCCTGGTGCTATCCCAGCTGCT 662
                                                                                                                                                                                                                The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition containing at least one purified recombinant HCV single or specific Oilgomeric recombinant envelope proteins selected from an B1 and an B2 protein, and optionally a pharmaceutical adjuvant. The vaccines are useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV B1 and/or B2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody tests, for raising antibodies, in the preparation of medicament, and for in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present sequence is a coding sequence described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    714

replicon enhanced cells are useful in studying HCV replication and expression, and HCV and host cell interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to modulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and hepatocellular carcinoma. The present sequence is an HCV replicon Con 1 mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the HCV sequence appearing as ABK91411 and the information in Claim 9
                                                                                                                                                                                                                                                                                                                      TIGGGIAAGGICATGGAIACCTCACGIGCGGCTTCGCCGAICTCATGGGGIACAITCCG

The invention relates to mucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (BMCV) internal ribosome entry site (IRRS) respon coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a mucleotide sequence coding for the altered nucleic cacids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids (2) a recombinant cell produced by introducing an HCV (hepatitis C virus) cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) caplicon enhanced cells made in the method; and (6) measuring the ablity of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and HCV replicon enhanced cells are useful in studying HCV replication and HCV and host cell interactions, producing HCV RNA and concludate one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and compound to more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and compand of the invention. Note: The present sequence is an HCV replicon Con 1 mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the HCV sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRBS) region, useful in studying HCV replication and

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS54, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered cell or which containing a functional HCV replicon; (5) an HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and proteins, and HCV and host cell interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to more HCV activities e.g. to discover drugs which may the HCV mediated diseases ment as laver failure, cirthosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New Hepatitis C virus (HCV) replicons comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region, useful in studying HCV replication and

The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (TRES) region coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression certor comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids; (3) a recombinant cell produced by introducing into a human hepatoma cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV acivity. The HCV replicans and HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV acivity. The HCV replication and expression, and HCV and host cell interactions producing HCV RNA and expression, and HCV and host cell interactions producing HCV RNA and combinate one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and compound to motellular carcinoma. The present sequence is an HCV replication in the appearing as ABK91411 and the information in Claim 9

Hepatitis C virus.

Synthetic

```
The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (TRES) region coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a nucleotide sequence coding for the altered nucleic caids which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell broadcade by introducing into a human hepatoma cell the altered mucleic acids (4) producing an HCV (hepatitis C virus) replicon enhanced cell or which containing a functional HCV replicon; (5) an HCV replicon enhanced cells made in the method, and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV and host cell interactions, producing HCV RAB and expression, and HCV and host cell interactions, producing HCV RAB and ceptression, and providing a system for measuring the ability of a compound to more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and chaptacedlular carcinoma. The present sequence is the HCV replicon Con 1, used as a basis for the adaptive mutations of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 996 ATGATCATGCATACCCCGGGTGCGTGCCTGCGTTCGGGAGAACAACTCCTCCCGCTGC 1055

          The invention relates to nucleic acid molecules comprising altered HCV NS3 or HCV NS5 encoding region, or encephalomyocarditis virus (EMCV) internal ribosome entry site (IRES) region coding for one or more NS3, NS5A, or EMCV IRES mutations, respectively. The location of the mutations are detailed in the specification. Also included are (1) an expression vector comprising a nucleotide sequence coding for the altered nucleic acids, which is transcriptionally coupled to an exogenous promoter; (2) a recombinant cell human hepatoma cell comprising the altered nucleic acids (3) a recombinant cell produced by introducing into a human hepatoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     603
cell the altered nucleic acids; (4) producing an HCV (hepatitis C virus) replicon enhanced cell or which containing a functional HCV replicon; (5) an HCV replicon enhanced cells made in the method; and (6) measuring the ability of a compound to affect HCV activity. The HCV replicons and HCV replicon enhanced cells are useful in studying HCV replication and expression, and HCV and host cell interactions, producing HCV RNA and proteins, and providing a system for measuring the ability of a compound to modulate one or more HCV activities e.g. to discover drugs which may treat HCV mediated diseases such as liver failure, cirrhosis and mutant of the invention. Note: The present sequence is an HCV replicon Con I mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the HCV sequence appearing as ABK91411 and the information in Claim 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        63

Determination of this BAC-end sequence was carried out as part of a collaboration with the Barkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster and project of the Drosophila melanogaster and please see http://www.fruitfly.org The BDGP Drosophila melanogaster at the Library was prepared by Kazucyo Osoegawa and melanogaster at the Rowell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial

BCORI digestion of Drosophila DNA provided by the BDGP from the lagogenic strain y2, cn bw sp, the same strain used for the BDGP Pl and BST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Allard, F., Crosby, W.L., Danyluk, J., Budes, P., Frick, M., Gaudet, E. /note="Vector: pCMV.SPORT6; Crown and developmental stages
of spike formation in wheat cultivar Norstar. 4 mRNA
populations were combined before constructing the library.
The first mRNA population is from lom crown sections after
30 days of cold acclimation. The second is from lom crown
sections after 11 days of deacclimation (before
deacclimation plants were fully vernalized for 49 days).
The third is from different developmental stages of spike
formation [5 to 50mm] that still have not emerged from the
leaf (dissection required). The last is from different
developmental stages of spike and seed formation after
having emerged from the leaf (visible). First strand
synthesis in this library was done in the presence of
methylated dCTP thereby protecting from internal cleavage
with Not!."
